

# NYC and London Crimes and Health Services

Capstone Project - Data Science Certification

# Cities of New York and London Violent Crime and Health Services in Neighborhoods

## Table of contents

- [Introduction: Business Problem](#)
- [Data Sources](#)
- [Methodology](#)
- [Analysis](#)
- [Results and Discussion](#)
- [Conclusion](#)

## • Introduction

The violent crime cases in either city (New York and London) will be geolocalized and the number of medical service points in the cities neighborhoods will be superimposed segmented and clustered to analyze the cities neighborhoods ability (indicative assessment) to provide the quickest health assistance to crime victims.

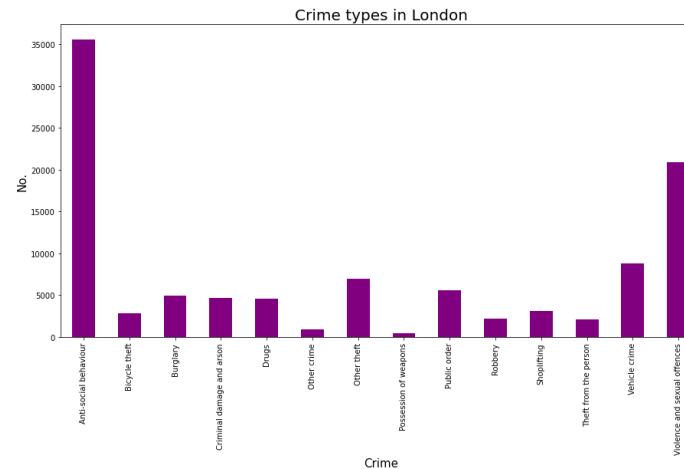

The analysis could be used by individuals or private business or by local governments to assess whether new health centers could be opened in areas where a need is revealed.

## • Data Sources:

### 1- Crime Data of each City:

- London Crime Data: <https://data.police.uk/data/fetch/5f1eb3b6-035e-420a-aed4-cadf6f2786e9/>
- New York Crime Data: <https://data.cityofnewyork.us/Public-Safety/NYC-crime/qb7u-rbmr>

### 2- Foursquare API: will be used to find health services in the London and NY neighborhoods.

# Using the crime data from the cities data and the Foursquare API – Generate Kmean Clusters

# Geolocalized Clusters

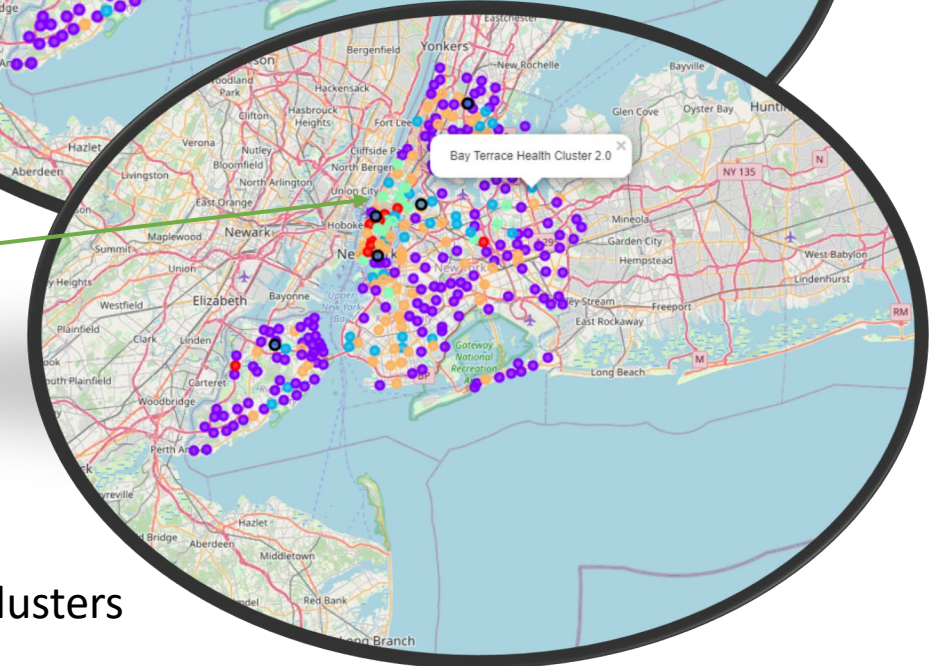

- Crime and Health Services clusters superimposed in the New York City map

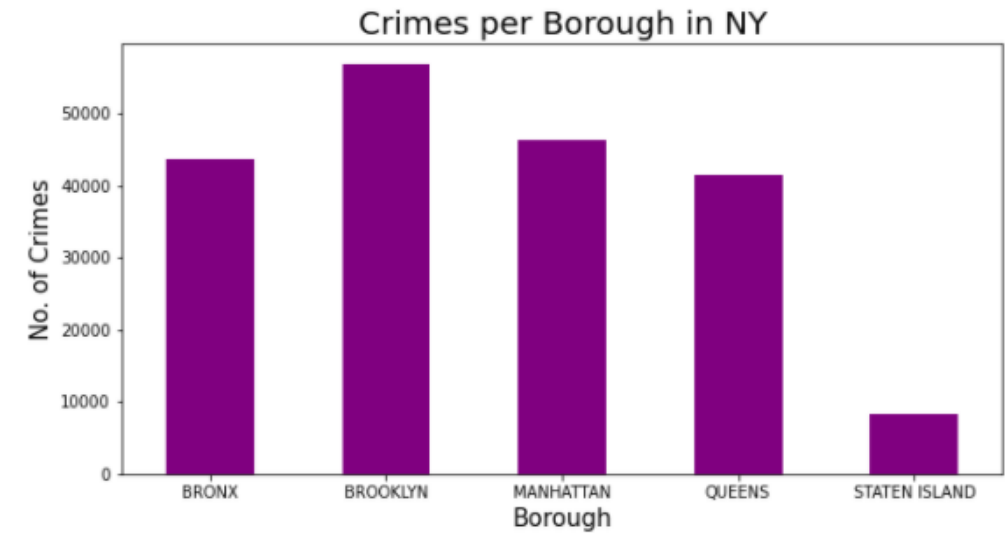

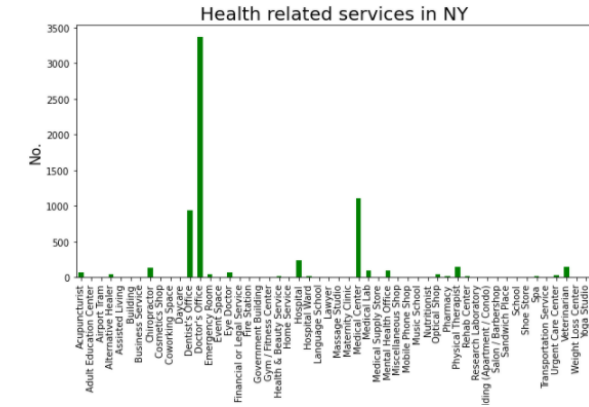

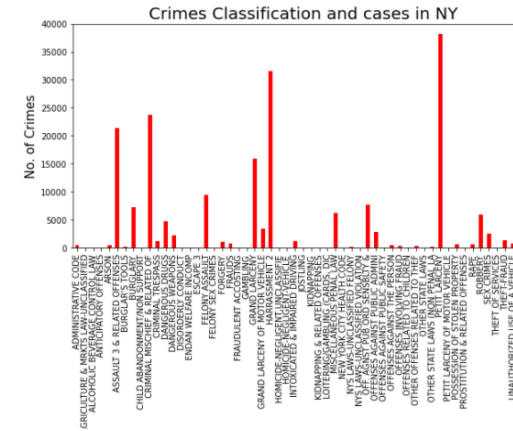

'Crime' Clusters

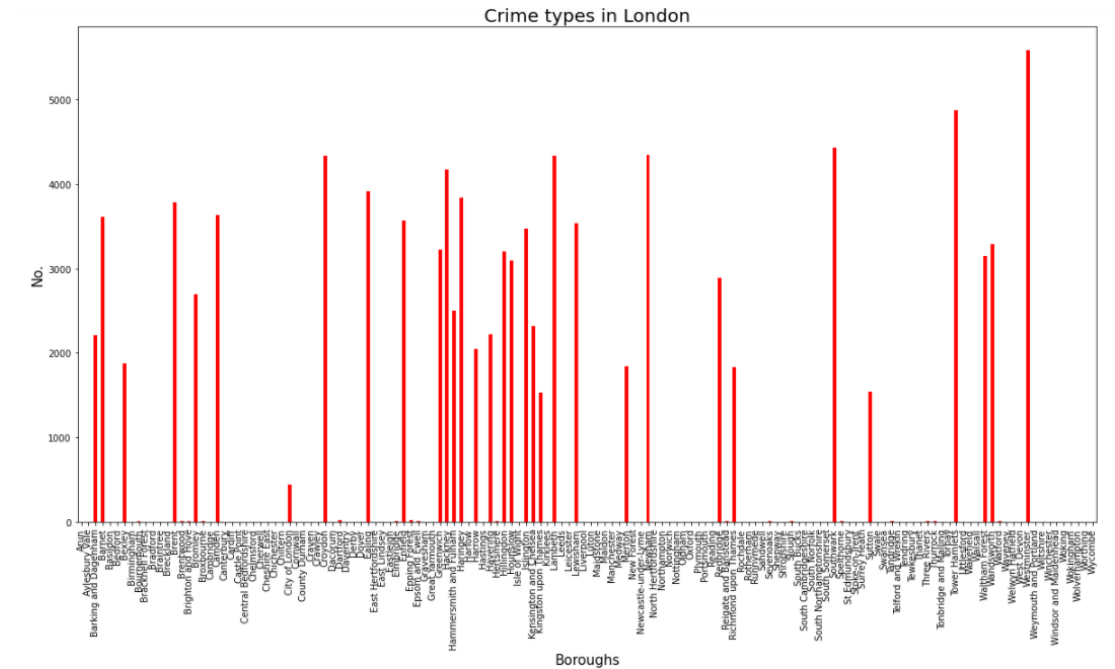

'Health' Clusters

- The bar plots for the crime and health services data was used to gain visual insight of the Borough and Neighborhoods trends.

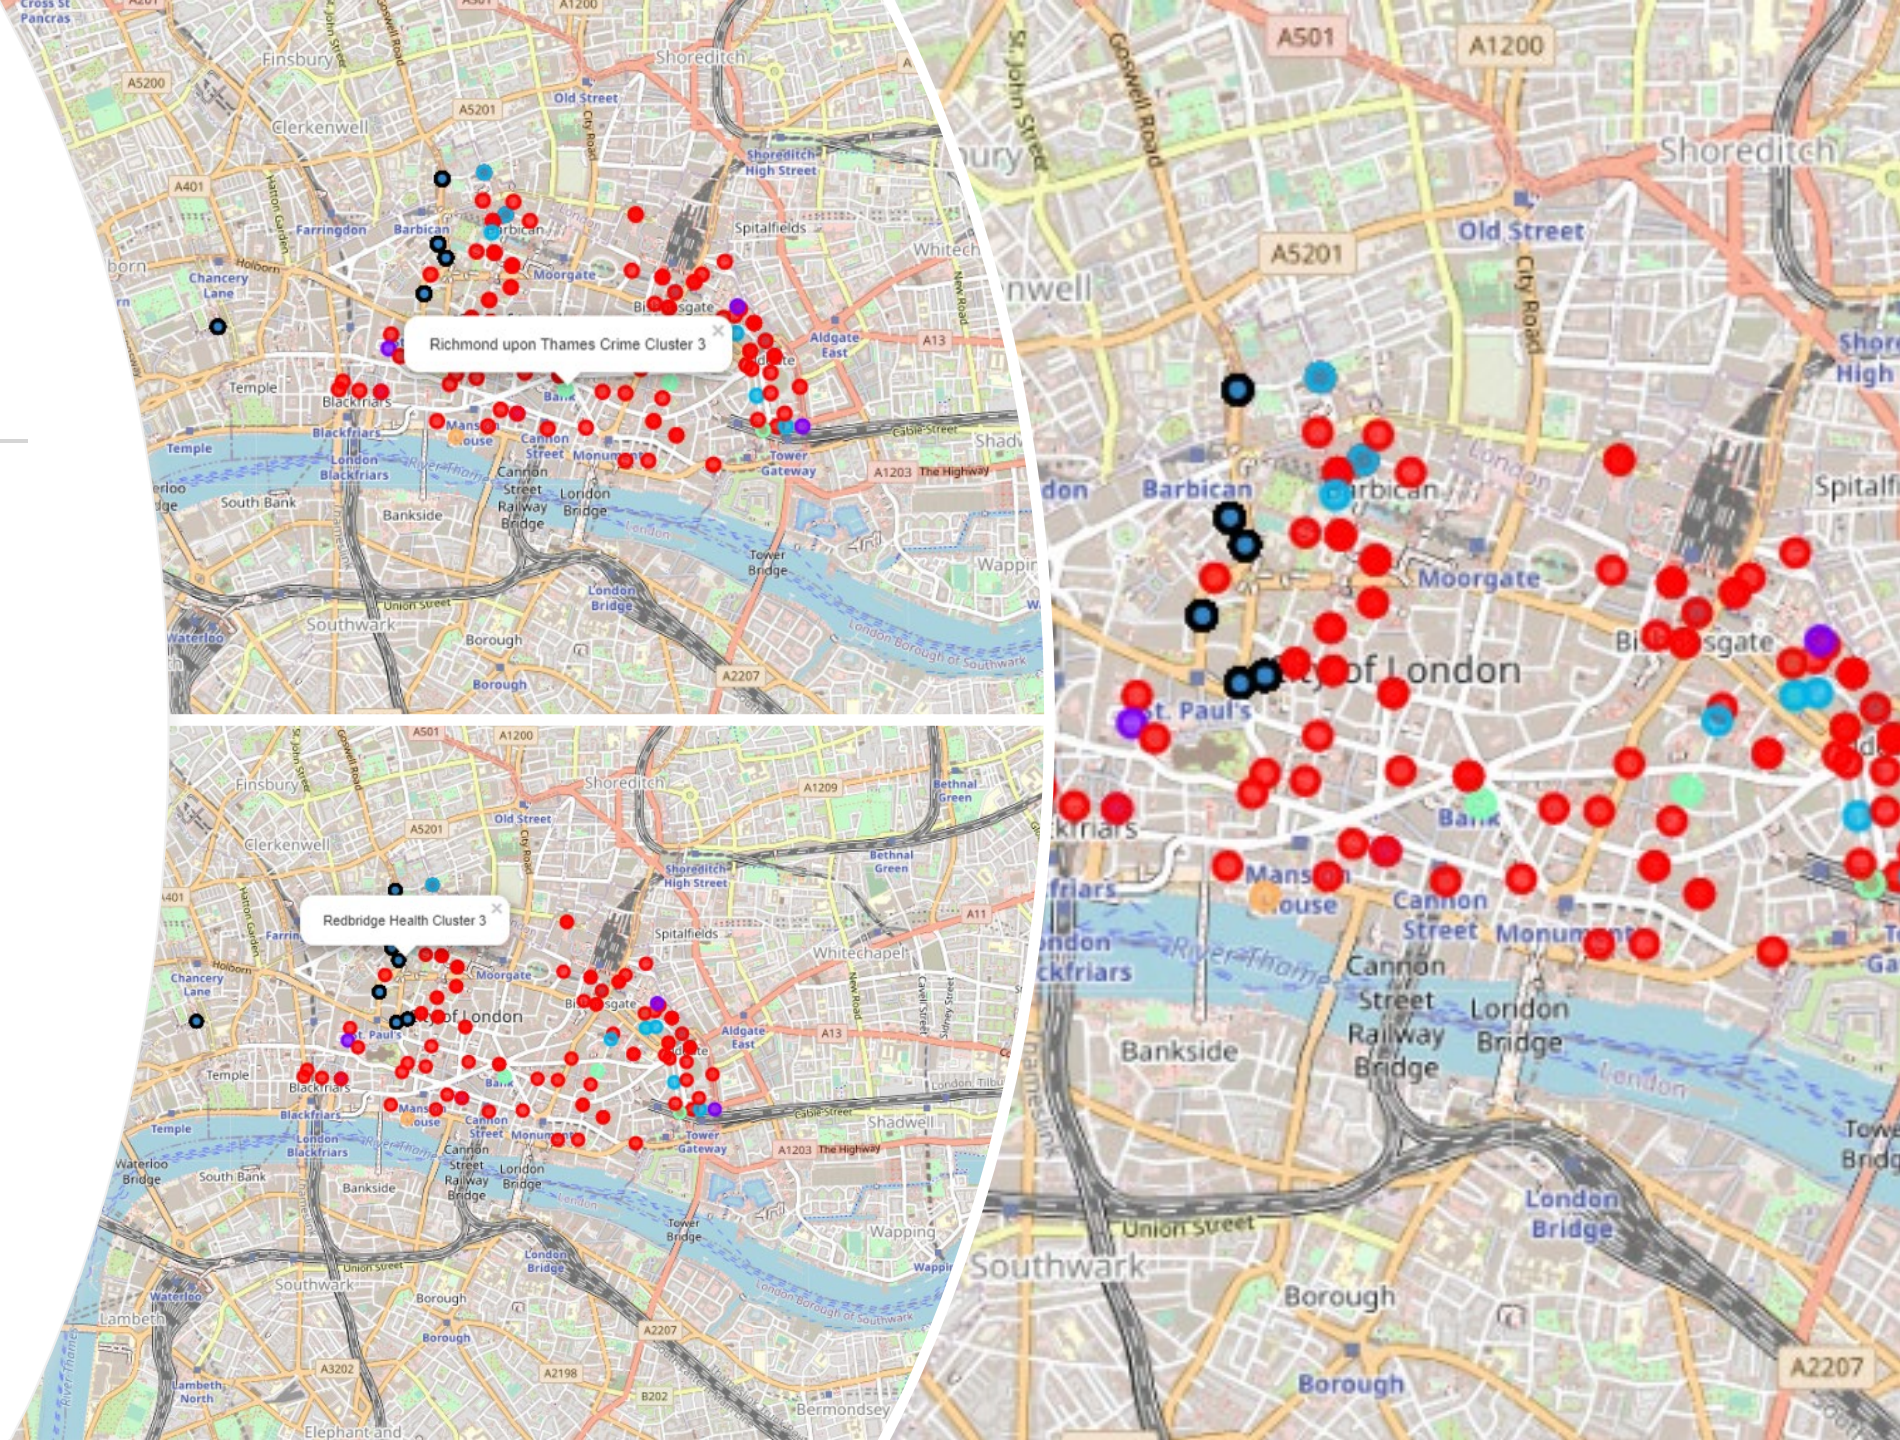

- The bar plots for the crime and health services data was used to gain visual insight of the Borough and Neighborhoods trends.

# London Crime and Health Clusters

- The same methodology used for NYC was applied to London Crime and Health Services data.
- The clusters of the most common crime types and the most common health services geolocalized in the London city map

# Results & Discussion

NYC appears to have a significantly larger number of violent crime cases than London (3 to 5-fold times) and equivalently the number of available health facilities shows a similar trend. This indicates no major difference in the ability of the city to provide health assistance. A more in-depth analysis but based on neighbourhoods:

- For the city of New York: The data indicates that the only based on the number of crimes the most dangerous (violent crimes) neighbourhoods are those of Bronx (Cluster 0) followed by Brooklyn and Manhattan (Cluster 2); Data shows Queens neighborhoods with more available medical services and thus an opportunity specifically for Brooklyn and Manhattan to improve.
- For the city of London: The data indicates that the only based on the number of crimes the most dangerous neighbourhoods are those of Westminster followed by Camden and Chelsea; Data shows Westminster neighborhoods with more available medical services and thus an opportunity specifically for Camden and Chelsea.

# Conclusions & Recommendations

- The goal of this project was to provide private businesses and/or local governments with an indicative assessment of the availability of health services in the neighborhoods of each city to provide assistance to the victims in relation with the number of crimes on each neighborhood. The project has achieved the indicative assessment.
- Recommendation: Further analysis based on violent vs non-violent crimes and the health facilities size/capacity to treat victims, etc. would be recommended to get a deeper insight to those planning to make health services investments.
